ABSTRACT

Describe what your project presents within 150 words.

Plagiarism is the practice of copying another person's work without giving proper credit. It is a common issue in educational institutions and online content creation. The **Word-Level Plagiarism Checker for Short Documents** is a simple application designed to detect plagiarism by comparing two short text documents at the word level. The system reads the input documents, breaks the text into individual words, and compares them to identify matching words. It then calculates the percentage of similarity between the documents and highlights the matched words for easy understanding. This helps users quickly identify copied content and evaluate the originality of a document. The project is useful for checking assignments, reports, articles, and other short text documents. It provides a fast, accurate, and user-friendly way to detect plagiarism without requiring complex algorithms. The system promotes academic honesty and encourages users to create original content while improving awareness about plagiarism.
